Installed Interconnection Bandwidth capacity is expected to reach more than 8,200 Tbps by 2021, a five-fold increase over five years with double-digit growth across all industries. By distributing your IT infrastructures to the edge and leveraging the proximity to vital digital and business ecosystems, you can reduce costs and realize a greater ROI from your Interconnection Bandwidth capacity.

Bandwidth and latency are attributes that characterize the speed of a network. Bandwidth, typically measured in bits, kilobits, or megabits per second, is the rate at which data flows over the network. This is a measure of throughput (amount per

An internet connection with a larger bandwidth can move a set amount of data (say, a video file) much faster than an internet connection with a lower bandwidth. Bandwidth is typically expressed in bits per second , like 60 Mbps or 60 Mb/s, to explain a data transfer rate of 60 million bits (megabits) every second.

SolarWinds Network Bandwidth Analyzer Pack is a product that can accurately measure the throughput of your network. You can view throughput flow data alongside monitoring bandwidth with SNMP. There is also a network throughput test that can be mixed with pre and post-QoS policy maps to show if your QoS policy is improving the performance of the network over time.

## **Throughput vs Bandwidth: Understanding the Difference + Tools**

The difference between bandwidth and latency is something that confuses a lot of people, but if you are an IT professional it would be useful to know the difference between the two because sooner or later you will face a network problem related to it.

The bandwidth consumed by this transmission can be huge and the total power transmitted is distributed over many hundreds of spectral lines. This is a potential source of interference with any other device and frequency-dependent imperfections in the transmit chain mean that some of this power never arrives at the antenna.
