the sum of the squares of the residuals made in the results of every single equation. The most important application is in data fitting. The best fit in the least-squares sense minimizes the sum of squared residuals. The Method of Least Squares is a procedure, requiring just some calculus and linear algebra, to determine what the “best fit” line is to the data. Of course, we need to quantify what we mean by “best fit”, which will require a

Indirect least squares Indirect least squares is an approach in econometrics where the coefficients in a simultaneous equations model are estimated from the reduced form model using ordinary least squares. For this, the structural system of equations is transformed into the reduced form first.

$x = \text{lsqr}(A,b)$  attempts to solve the system of linear equations  $A*x = b$  for  $x$  using the Least Squares Method.  $\text{lsqr}$  finds a least squares solution for  $x$  that minimizes  $\text{norm}(b-A*x)$ . When  $A$  is consistent, the least squares solution is also a solution of the linear system.
